

Would you survive?

All that you can remember of last night are the waves that crashed onto your ship tearing it apart and then being thrown into the sea. This morning you found yourself washed up on a deserted, tropical island completely alone. Whilst searching the shore line you discover a box of matches, an old exercise book, a pencil and your favourite metal dinner plate.

The first part of your task

- As a scientist record all the problems you need to overcome by nightfall to survive.
- Now in the exercise book list these problems in their order of urgency.
- Give some explanation for the order of your priorities.

The second part of your task

- To survive you have to find a way of producing sufficient drinking water. There is no clean drinking water on the island; you will have to use sea water. Plan in the exercise book how you will solve this problem. You may wish to test out your solution to the problem. Make sure you check with your teacher that what you suggest is safe.
